# History of Dark Matter in 2 mins.

## 1. Dark Matter exists

*Kapteyn 1922, Oort 1927, Zwicky 1933, 1937;  
Schmidt 1936,; Hulst et al 1957; Freeman 1970;  
Shostak and Rogstad 1972; Roberts and Rots  
1973, Rubin et al. 1978, Bosma 1978*

## 2. Dark Matter is ubiquitous

*[Finzi 1959!], Ostriker, Peebles, Yahil 1974, Einasto et  
al. 1974, Faber & Gallagher 1979*

## 3. Dark Matter is a new particle

*Peebles 1982 + Pagels, Primack, Bond, Szalay, White, ..*

**Public Symposium:**  
join world-leading  
cosmologists who  
pioneered the discovery of  
dark matter to discuss its  
history and the prospects  
for detecting it.

**Gianfranco Bertone**  
**Albert Bosma**  
**Jim Peebles**  
**Bernard Sadoulet**  
**Joe Silk**  
**Michael Turner**  
**Simon White**

**Round tables chaired by  
Jeroen van Dongen & Dan Hooper**

**Tickets are 15€ p.p. and can only be bought online via the website.**

[dmsymposium.science.uva.nl](https://dmsymposium.science.uva.nl)

**Videos of all lectures  
will be online soon....**

# What do we know?

An extraordinarily rich zoo of non-baryonic Dark Matter candidates! In order to be considered a viable DM candidate, a new particle has to pass the following 10-point test

1)  $\Omega h^2$  OK?

2) Is it cold?

3) Is it neutral?

4) Is BBN ok?

5) Stars OK?

TAOSO, GB & MASIERO 2007

# What do we know?

## Has dark matter finally been detected?

Hunt may well be over for a mysterious and invisible substance that accounts for three-quarters of the matter in the universe

# The DM candidates Zoo

## WIMPs

### NATURAL CANDIDATES

Arising from theories addressing the stability of the electroweak scale etc.

- **SUSY** Neutralino
- Also: LKP, Lzp, LTP, etc.

### AD-HOC CANDIDATES

Postulated to solve the DM Problem

- Minimal DM
- Maverick DM
- etc.

## Other

### ✦ AXIONS

Postulated to solve the strong CP problem

### ✦ STERILE NEUTRINOS

### ✦ SUPERWIMPs

Inherit the appropriate relic density from the decay of the NTL particle of the new theory

### ✦ WIMPLESS

Appropriate relic density achieved by a suitable combination of masses and couplings

**Indirect Detection**

# Indirect Detection

WHY “ANNIHILATIONS”?

**X** = DARK MATTER

**SM** = STANDARD MODEL PARTICLE

EARLY UNIVERSE

$$\frac{dn_\chi}{dt} - 3Hn_\chi = -\langle\sigma v\rangle [n_\chi^2 - (n_\chi^{\text{eq}})^2]$$

RELIC DENSITY (NR FREEZE-OUT)

$$\Omega h^2 \approx \frac{3 \times 10^{-27} \text{cm}^3 \text{s}^{-1}}{\langle\sigma v\rangle}$$

Electroweak-scale cross sections can reproduce correct relic density.

TODAY

$$\frac{dn_\chi}{dt} = -(\sigma v)_0 n_\chi^2$$

ANNIHILATION FLUX

$$\Phi_i(\Omega, E_i) = \frac{dN}{dE_i} \frac{\langle\sigma v\rangle}{8\pi m_\chi^2} \int_{\text{los}} \rho_\chi^2(\ell, \Omega) d\ell$$

Particle physics input from extensions of the Standard Model. Need to specify distribution of DM along the line of sight.

RECENT RESULTS: DAYLAN ET AL. ARXIV:1402.6703

FIG. 9: The raw gamma-ray maps (left) and the residual maps after subtracting the best-fit Galactic diffuse model, 20 cm template, point sources, and isotropic template (right), in units of photons/cm<sup>2</sup>/s/sr. The right frames clearly contain a significant central and spatially extended excess, peaking at ~1-3 GeV. Results are shown in galactic coordinates, and all maps have been smoothed by a 0.25° Gaussian.

“Within these maps, we find the GeV excess to be robust and highly statistically significant, with a spectrum, angular distribution, and overall normalization that is in good agreement with that predicted by simple annihilating dark matter models”

See also thorough analysis in Calore et al. arXiv:1409.0042

# The GeV excess

<http://arxiv.org/abs/1402.6703>

“To constrain the degree to which the gamma-ray excess is spatially extended, we have repeated our Inner Galaxy analysis, replacing the dark matter template with a series of concentric ring templates centered around the Galactic Center.

The dark-matter-like emission is clearly and consistently present in each ring template out to  $12^\circ$ , beyond which systematic and statistical limitations make such determinations difficult. For comparison, we also show the predictions for a generalized NFW profile with  $\gamma = 1.4$ ”

# The GeV excess

<http://arxiv.org/abs/1402.6703>

...so what?!

# The trouble with indirect searches

... the “inverse problem” always admits a solution, even when the data have nothing to do with DM!

# How do we convince ourselves?

(example in the stau coannihilation region, 24 parms MSSM)

GB, CERDENO, FORNASA, RUIZ DE AUSTRI & TROTTA, 2010

# “Scaling” Ansatz

$$\frac{\rho_\chi}{\rho_{dm}} = \frac{\Omega_\chi}{\Omega_{dm}}$$

# Conclusions

- *Huge* Theoretical and experimental effort towards the identification of DM. It is OK to be skeptical about claims of detection..
- *Indirect Detection* more and more constrained, but there are some tantalizing hints
- DM *Direct Detection* looks promising. Info from other experiments is needed to determine DM parameters
- Run II of the LHC (2015) will provide crucial information! Even in case of direct and indirect searches likely necessary to identify DM
- Next 5-10 years are crucial: this is the *moment of truth* for WIMP Dark Matter!
